

LabCorp - Established Account

Guidelines from the American Cancer Society (ACS) and the U.S. Preventive Services Taskforce recommend colorectal cancer screening for patients ages 50 and older, as well as for younger patients with an increased risk of developing colorectal cancer.

High-sensitivity fecal occult blood tests (FOBT) are one option for colorectal cancer screening. Examples include the fecal immunochemical tests (FIT) and the guaiac-based FOBT.

Surveys show that 90 percent of people who reported a physician recommendation for colon cancer testing were screened versus 17 percent of those who reported that they did not have a provider recommendation.

In a recent ACS survey, “My doctor did not recommend it” was the primary reason for not getting screened among African Americans and the third most commonly cited reason among Hispanics.

As a physician, your recommendation is the most influential factor in whether a person decides to get screened. Working with CDPHP® and LabCorp, you can help your patients overcome the barriers that may have prevented them from getting screened in the past.

To obtain a supply of FIT Kits, use any of the following options: LabCorp Beacon web application, interface, fax, or contact your LabCorp representative.

LabCorp Account# _____

To facilitate patient compliancy, the FIT Kit can be mailed directly to LabCorp once the procedure is completed. Please note a LabCorp Test Requisition Order form must be completed by the provider and included with the kit. Your office will receive the results via your selected mode of report (interface, courier, etc.), within five days following receipt of the kit transmission. Your patients can also access their results through the LabCorp patient portal.

For information on the FIT Kit, please read: “A Technical Review, Immunochemical Colorectal Cancer Screening, An Improved Fecal Occult Blood Test.”
